Inline Terminal<br>With Four Relay Changeover Contacts

The IB IL 24/230 DOR 4/W-PC and IB IL 24/230 DOR 4/W-PC-PAC only differ in the scope of supply (see "Ordering Data" on page 17). Their function and technical data are identical.

For greater clarity, the Order Designation IB IL 24/230 DOR 4/W-PC is used throughout this document.

This data sheet is only valid in association with the IB IL SYS PRO UM E User Manual or the Inline System Manual for your bus system.

## Function

The terminal is designed for use within an Inline station. It has four electrically isolated relay changeover contacts. The terminal is suitable for switching inductive and capacitive loads.

The terminal can be used in the SELV area and in the AC area. Observe the appropriate regulations and safety notes when using the terminal in the AC area.

Please use the IB IL 24/230 DOR 4/W terminal for switching voltages less than 12 V or currents less than 100 mA .

## Features

- Safe isolation according to EN 50178
- Electrically isolated connection for four actuators
- Nominal current at the output: 3 A
- Total current of the terminal: $4 \times 3 \mathrm{~A}=12 \mathrm{~A}$
- LED diagnostic and status indicators

## Safety Notes

Safety notes for Inline terminals for installation in voltage ranges outside the SELV (AC area)
Only qualified personnel may work on Inline terminals in the AC area.
Qualified personnel are people who, because of their education, experience, and instruction and their knowledge of relevant standards, regulations, accident prevention, and service conditions, have been authorized by those responsible for the safety of the plant to carry out any required operations and who are able to recognize and avoid any possible dangers.
(Definitions for skilled workers according to EN 50110-1:1996.)

The instructions given in the IB IL SYS PRO UM E User Manual or the Inline System Manual for your bus system and in this data sheet must be followed during installation and startup.
Technical modifications reserved.

## Correct Usage

The terminal is only to be used within an Inline station as specified in this data sheet and the IB IL SYS PRO UM E User Manual or the Inline System Manual for your bus system. Phoenix Contact accepts no liability if the device is used for anything other than its designated use.

## Dangerous voltage

Please note that there are dangerous voltages when switching circuits that do not meet SELV requirements.

Only remove and insert the AC terminals when the power supply is disconnected. When working on terminals and wiring, always switch off the supply voltage and ensure it cannot be switched on again.

## Installation Instructions and Notes

Please use grounded AC networks Inline AC terminals must only be operated in grounded AC networks.
Install the system according to the requirements of EN 50178.

## Read the user manual

Please observe the installation instructions and installation notes in the IB IL SYS PRO UM E User Manual or the Inline System Manual for your bus system, especially the information about the low voltage area.

## Special Features of the IB IL 24/230 DOR 4/W-PC Terminal

Loads up to 230 V can be switched using the IB IL 24/230 DOR 4/W-PC terminal.

Please note that the
IB IL 24/230 DOR 4/W-PC terminal interrupts the potential jumpers $\mathrm{U}_{\mathrm{M}}$, $\mathrm{U}_{\mathrm{S}}$, and GND ( 24 V area) as well as L and N ( $120 \mathrm{~V} / 230 \mathrm{~V}$ areas). If required, these supply voltages must be reintroduced/ provided after the relay terminal using an appropriate power terminal.

## Switching Loads in the 230 V Area

To switch voltages outside the SELV area, an AC area must be created corresponding to the installation instructions and notes given in the user manual.

$\triangle$

## Switching Voltages That Are Not Available in the Segment

A relay terminal can be used to switch voltages that are not available in the segment in which the terminal is located (e.g., switching 230 V AC within a 24 V DC segment).
In this case, place a distance terminal before and after the IB IL 24/230 DOR 4/W-PC terminal (see "Ordering Data" on page 17). The isolating distances between the individual areas are thus maintained.

See also "Connection Examples" on page 6.

In the corresponding connector IB IL SCN-8-AC-REL, the adjacent contacts
1.2/2.2, 1.3/2.3, and 1.4/2.4 are jumpered.

It is therefore possible to transmit the power to supply several relays of IB IL 24/230 DOR 4/W-PC terminals from one connector to the next via a jumper.

Please note that the current at one terminal point must not exceed 8 A .

## Interference Suppression Measures on Inductive Loads/Switching Relay

Each electrical load is a mixture of ohmic, capacitive, and inductive elements. Depending on the proportion of the element, switching these loads results in a larger or smaller load on the switch contact.
In practice, loads are generally used with a large inductive element, such as contacts, solenoid valves, motors, etc. Due to the energy stored in the coils, voltage peaks of up to several thousand volts may occur when the system is switched off.
These high voltages cause an arc, which may destroy the controlling contact through material evaporation and material transfer.

This pulse, which is similar to a square wave pulse, emits electromagnetic pulses over a wide frequency range with a large amount of power and with spectral elements reaching several MHz .

To prevent such arcs from occurring it is necessary to fit the contacts/loads with protective circuits. The following protective circuits can be used:

- Contact protective circuit
- Load protective circuit
- Combination of both protective circuits

Figure 8 Contact protective circuit (A), load protective circuit (B)

If sized correctly, these circuit versions do not differ greatly in their effectiveness. In principle, a protective measure should be directly implemented at the source of the interference. In addition, the following points should be observed for a load protective circuit:

- When the contact is open, the load is electrically isolated from the operating voltage.
- It is not possible for the load to be activated or to "stick" due to undesired operating currents, e.g., from RC elements.
- Shutdown voltage peaks cannot be coupled in control lines that run in parallel.
Phoenix Contact provides protective circuit solutions in terminal format or in electronic housing (see the "CLIPLINE" catalog or "TRABTECH" catalog). Additional information is available on request. In addition to this, today the majority of contact manufacturers offer diode, RC or varistor elements that can be snapped on. For solenoid valves, connectors with an integrated protective circuit can be used.

## Switching AC/DC Loads

## Switching Large AC Loads

When switching large AC loads, the relay can be operated up to the corresponding maximum values for switching voltage, current, and power. The arc that occurs during shutdown depends on the current, voltage, and phase angle. This shutdown arc switches off automatically the next time the load current passes through zero.

In applications with an inductive load, an effective protective circuit must be provided, otherwise the life of the system will be reduced considerably.

To prolong the life of the IB IL 24/230 DOR 4/W-PC terminal as mush as possible when using lamp loads or capacitive loads, the current peak must not exceed 6 A when the load is switched on.

## Switching Large DC Loads

In DC operation, a relay can only switch a relatively low current compared with the maximum permissible alternating current. This maximum direct current value is also highly dependent on the voltage and is determined in part by design conditions, such as the contact distance and contact opening speed.
The corresponding current and voltage values are shown in Figure 9.

Figure 9 DC load limiting curve
(REL-SNR-1XU/G 5 GOLD relay)
I Switching current in A
$U \quad$ Switching voltage in $V$
Definition of the load limiting curve: For 1000 cycles, no constant arc should occur with a burning life $>10 \mathrm{~ms}$.

An unattenuated inductive load further reduces the values given here for switching currents. The energy stored in the inductivity can cause an arc to occur which forwards the current via the open contacts. Using an effective contact protective circuit in relay contacts with the same life enables you to switch currents that are virtually the same as with ohmic loads.

$\triangle$
If it is permitted to switch higher DC loads, several relay contacts can be switched in parallel.

Additional technical data is available on request.
