## IB IL PWM/2 (-PAC)

## Inline Function Terminal for Pulse Width Modulation and Frequency Modulation

## AUTOMATIONWORX

Data Sheet

6920_en_01
© PHOENIX CONTACT - 03/2007

## 1 Description

The terminal is designed for use within an Inline station. It can be used in four different operating modes:

- PWM (pulse width modulation)
- Frequency generator
- Single shot (single pulse generator)
- Pulse direction signal

## Features

- Two channels that operate independently
- Output signals as 5 V or 24 V signals
- Two digital outputs, 5 V DC, 10 mA ,

0 Hz to 50 kHz , with an ohmic load capacity, for the connection of high-resistance non-inductive input circuits (e.g., solid-state relays)

- Two digital outputs, 24 V DC, 500 mA ,

0 Hz to 500 Hz , with an ohmic and inductive load
capacity, suitable for the direct control of loads

- Short-circuit and overload protected outputs

This data sheet is only valid in association with the IL SYS INST UM E user manual or the Inline system manual for your bus system.

## 3 Technical Data

| General Data |  |
| :---: | :---: |
| Housing dimensions (width x height x depth) | 24.4 mm x $120 \mathrm{~mm} \times 71.5 \mathrm{~mm}$ |
| Weight | 90 g (without connector), 130 g (with connector) |
| Operating mode | Process data mode with 2 words |
| Transmission speed | 500 kbps |
| Connection method for actuators | 2 and 3-wire technology |
| Ambient temperature (operation) | $-25^{\circ} \mathrm{C}$ to $+55^{\circ} \mathrm{C}$ |
| Ambient temperature (storage/transport) | $-25^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Permissible humidity (operation/storage/transport) | 10\% to 95\% according to DIN EN 61131-2 |
| Permissible air pressure (operation/storage/transport) | 70 kPa to 106 kPa (up to 3000 m above sea level) |
| Degree of protection | IP20 according to IEC 60529 |
| Class of protection | Class 3 according to VDE 0106, IEC 60536 |
| Connection data for Inline connector |  |
| Connection type | Spring-cage terminals |
| Conductor cross-section | $0.2 \mathrm{~mm}^{2}$ to $1.5 \mathrm{~mm}^{2}$ (solid or stranded), 24-16 AWG |
|  |  |
| Interface |  |
| Local bus | Through data routing |
| Power Consumption |  |
| Communications power | 7.5 V DC |
| Current consumption at $\mathrm{U}_{\mathrm{L}}$ | 130 mA , maximum |
| Power consumption at $U_{L}$ | 0.98 W , maximum |
| Segment supply voltage $U_{S}$ | 24 V DC (nominal value) |
| Nominal current consumption at $\mathrm{U}_{\mathrm{S}}$ | 1 A |

| Supply of the Module Electronics and I/O Through Bus Coupler/Power Terminal |  |
| :---: | :---: |
| Connection method | Through potential routing |
| Digital Outputs |  |
| 24 V DC |  |
| Number | 2 |
| Nominal output voltage $\mathrm{U}_{\text {OUT }}$ | 24 V DC |
| Differential voltage at $I_{\text {nom }}$ | $\leq 1 \mathrm{~V}$ |
| Nominal current $\mathrm{I}_{\text {nom }}$ per channel | 0.5 A |
| Tolerance of the nominal current | +10\% |
| Internal resistance | $200 \mathrm{~m} \Omega$ |
| Protection | Short circuit; overload |
| Nominal load |  |
| Ohmic | 12 W |
| Lamp | 12 W |
| Inductive | $12 \mathrm{VA}(1.2 \mathrm{H}, 24 \Omega)$ |
| Signal delay upon power up of: |  |
| Nominal ohmic load | Approximately $80 \mu$ s, typical |
| Nominal lamp load | 30 ms , typical |
| Nominal inductive load | $50 \mathrm{~ms}(1.2 \mathrm{H}, 24 \Omega)$, approximately |
| Signal delay upon power down of: |  |
| Nominal ohmic load | $80 \mu \mathrm{~s}$, approximately |
| Nominal lamp load | $100 \mu \mathrm{~s}$, approximately |
| Nominal inductive load | $150 \mathrm{~ms} \mathrm{(1.2} \mathrm{H} ,24 \Omega$ ), approximately |
| Switching frequency with: |  |
| Nominal ohmic load | 500 Hz , maximum |
| Nominal lamp load | 500 Hz , maximum |
| Nominal inductive load | $0.3 \mathrm{~Hz}(1.2 \mathrm{H}, 12 \Omega)$, maximum |
| Overload response | Auto restart |
| Response time in the event of a short circuit | 400 ms , approximately |
| Reverse voltage protection against short pulses | Protected against reverse voltages |
| Resistance to permanently applied reverse voltages | Protected against reverse voltages within the permissible supply voltage range up to 2 A DC |
| Resistance to polarity reversal of the supply voltage | Protective elements in the bus coupler or power terminal |
| Resistance to permanently applied surge voltage | No |
| Validity of output data after connecting the 24 V supply voltage (power up) | 1 ms , typical |
| Response upon power down | The output follows the supply voltage without delay. |
| Limitation of the voltage induced on circuit interruption | -25 V, approximately |
| One-time unsolicited energy | 200 mJ |
| Protective circuit type | Integrated free-wheeling diode for each channel |
| Overcurrent shutdown | 0.7 A , minimum |
| 5 V DC |  |
| Number | 2 |
| Nominal output voltage $\mathrm{U}_{\text {OUT }}$ | 5 V DC |
| Differential voltage for $\mathrm{I}_{\text {nom }}$ | 0.5 V |
| Nominal current $I_{\text {nom }}$ per channel | 10 mA |
| Tolerance of the nominal current | +10\% |
| Internal resistance | $50 \Omega$ |
| Protection | Short circuit; overload |
| Nominal load | $500 \Omega$ |
| Signal delay upon power up of a nominal ohmic load | $2 \mu \mathrm{~s}$ |
| Signal delay upon power down of a nominal ohmic load | $2 \mu \mathrm{~s}$ |
| Switching frequency with ohmic nominal load | 50 kHz |

## Power Dissipation

Formula to Calculate the Power Dissipation of the Electronics

| $\mathrm{P}_{\text {TOT }}=\mathrm{P}_{\text {Bus }}+\mathrm{P}_{\text {Out5V }}+\mathrm{P}_{\text {Out24V }}$ | Where |  |
| :---: | :---: | :---: |
|  | $\mathrm{P}_{\text {TOT }}$ | Total power dissipation in the terminal |
| $\mathrm{P}_{\text {TOT }}=1 \mathrm{~W}+\sum_{i=1}^{n}\left(\mathrm{I}_{\mathrm{Li}}{ }^{2} \times 0.4 \Omega\right)$ | $\mathrm{P}_{\text {Bus }}$ | Power dissipation in the terminal without set output |
|  | $\mathrm{P}_{\text {Out } 5 \mathrm{~V}}$ | Power dissipation in the terminal through set 5 V outputs; This value is negligible and therefore not included in the calculation. |
|  | Pout 24 V | Power dissipation in the terminal through set 24 V outputs |
|  |  | Number of set 24 V outputs ( $\mathrm{n}=1$ to 2 ) |
|  | $\mathrm{l}_{\mathrm{Li}}$ | Load current of output i |
|  | i | Continuous index |

## Power Dissipation of the Housing $\mathrm{P}_{\text {нои }}$

1.2 W, maximum (within the permissible operating temperature)

## Safety Equipment

| Overload/short circuit in segment circuit | Electronic |
| :--- | :--- |
| Surge voltage | Protective elements of the power terminal |
| Polarity reversal of the supply voltage | Proctive elements in the power terminal; <br> The supply voltage must be protected. The power supply unit should be able <br> to supply 4 times ( $400 \%$ ) the nominal current of the fuse |
| Reverse voltage of the 24 V output | Protected against reverse voltages within the permissible supply voltage up <br> to 2 A |

## Electrical Isolation/lsolation of the Voltage Areas

To provide electrical isolation between the logic level and the I/O area, it is necessary to supply the station bus coupler and the terminal via the bus coupler or a power terminal from separate power supply units. Interconnection of the power supply units in the 24 V area is not permitted. (See also user manual.)
Common Potentials
The 24 V main voltage, 24 V segment voltage, and GND have the same potential. FE is a separate potential area.

## Separate Potentials in the System Consisting of Bus Coupler/Power Terminal and I/O Terminal - Test Distance <br> - Test Voltage

5 V supply incoming remote bus / 7.5 V supply (bus logic)
5 V supply outgoing remote bus / 7.5 V supply (bus logic)
7.5 V supply (bus logic) / 24 V supply (I/O)
7.5 V supply (bus logic) / 5 V supply (I/O)

24 V supply (I/O) / functional earth ground
5 V supply (I/O) / functional earth ground

500 V AC, $50 \mathrm{~Hz}, 1 \mathrm{~min}$
500 V AC, $50 \mathrm{~Hz}, 1 \mathrm{~min}$
$500 \mathrm{~V} \mathrm{AC}, 50 \mathrm{~Hz}, 1 \mathrm{~min}$
500 V AC, $50 \mathrm{~Hz}, 1$ min
$500 \mathrm{~V} \mathrm{AC}, 50 \mathrm{~Hz}, 1 \mathrm{~min}$
500 V AC, $50 \mathrm{~Hz}, 1 \mathrm{~min}$

## Error Messages to the Higher-Level Control or Computer System

| Short circuit/overload of a 24 V output | Yes |
| :--- | :--- |
| Short circuit/overload of a 5 V output | No |

Operating voltage out of range No

## 6 Terms and Abbreviations Used

| PWM: | Pulse width modulation |
| :--- | :--- |
| Duty cycle: | High phase of the period |
| Period: | Duration of the signal to be generated |
| Single shot: | Single pulse |
| LSB: | Least significant bit |

## 7 Overview of the Operating Modes

The terminal can be used in four different operating modes:

### 7.1 PWM (Pulse Width Modulation) With Variable Duty Cycle

This operating mode can be used, for example, to control solid-state relays.
It is suitable for regulating the drive temperature and specifying the drive speed.
This operating mode supports a frequency of up to 10 kHz .
7.2 Frequency Generator With Constant Duty Cycle

This operating mode can be used, for example, to specify the drive speed.
This operating mode supports a frequency of up to 50 kHz .

### 7.3 Single Shot (Single Pulse Generator)

In this operating mode, single pulses can be generated with a variable duration of between $10 \mu \mathrm{~s}$ and 25.5 s .
These pulses can be used, for example, to control the opening time of a valve.

### 7.4 Pulse Direction Signal

This operating mode can be used, for example, to control stepper motors.
A frequency of up to 25 kHz and a target position can be specified.

### 7.5 Selecting the Operating Mode

The terminal does not require separate parameterization. The operating mode is selected by sending output words.

A separate operating mode can be selected for each channel except in pulse direction signal mode. When the terminal is operating in pulse direction signal mode, both outputs are required for this mode.

### 7.6 Changing the Operating Mode

To change mode, disable the active operating mode, before selecting the new mode.

The following parameters stop the relevant operating mode:

| PWM: | Duty cycle $=0$ |
| :--- | :--- |
| Frequency <br> generator: | Frequency $=0$ |
| Single shot: | Factor $=0$ |
| Pulse direction <br> signal: | Frequency $=0$ and Reset bit $=0$ |

Frequency $\quad$ Frequency $=0$ generator:
Single shot: Factor $=0$
Pulse direction Frequency =0 and Reset bit =0 signal:

## 8 Special Features of the Terminal

Each of the two output signals is available for one 5 V and one 24 V output.
The 5 V outputs support all frequencies. The 24 V outputs are only operated at up to 500 Hz . At higher frequencies or for pulses that are shorter than $100 \mu \mathrm{~s}$, the 24 V outputs reset to 0 .

Following a bus reset, all outputs are reset and all output activities are stopped.

## 9 Process Data

The process image of the terminal comprises two data words; one in the input direction and one in the output direction. They may be assigned differently depending on the operating mode.

In PWM, frequency generator, and single shot (single pulse generator) mode, each channel occupies one word and operates independently of the other channel. In this case, the process data is assigned as follows:

|  | Process data word 0 | Process data word 1 |
| :---: | :---: | :---: |
| OUT | Word for output of <br> channel 1 | Word for output of <br> channel 2 |

IN

| Word for output of <br> channel 1 mirrored | Word for output of <br> channel 2 mirrored |
| :--- | :--- |

The "Word for output of channel 1" applies to both the 24 V output of channel 1 and 5 V output of channel 1 .
The "Word for output of channel 2" applies to both the 24 V output of channel 2 and 5 V output of channel 2 .

In PWM, frequency generator, and single shot (single pulse generator) mode, the output data is mirrored to the input data as long as it is valid. If the output data contains reserved codes and is thus invalid, the data is not mirrored. In this case, the input data contains the last valid values.

In pulse direction signal mode, both outputs are controlled together and the terminal operates on a single channel.

Terminal parameterization is not required.

| hex | 1 |  |  |  | 2 |  |  |  | 3 |  |  |  | 5 |  |  |  |

## 12 PWM (Pulse Width Modulation) Mode

This operating mode is used to specify a pulse/pause ratio in a period. At a set frequency (as a result of specifying the period length), specify the changing duty cycle. Continuous pulses are generated.
A period length of between $100 \mu \mathrm{~s}$ and 10 s can be specified. This covers a frequency range of 10 kHz to 0.1 Hz . The selected duty cycle can be between $0.39 \%$ and $99.45 \%$.
PWM mode can be used, for example, to control solid-state relays. It is suitable for regulating the drive temperature and specifying the drive speed.

Figure 3 PWM with constant period $(\mathrm{P})$ and variable duty cycle of $40 \%$ or $80 \%$
PWM mode can be selected for one channel or both channels. The corresponding output word has the following structure:
Output word

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| bin | 0 | 1 | 0 | Period length (5 bits) |  |  |  |  |  |  |  |  |  |  |  |  |
|  | High byte (HB) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

The corresponding input word contains the mirrored values of the output word.
The table below contains all the possible values for the period length. The high byte (HB) is listed for additional information. It consists of the operating mode and period length.

| HB <br> $(\mathbf{h e x})$ | Period <br> $(\boldsymbol{\mu s})$ | Frequency <br> $\mathbf{( k H z )}$ |

| 55 | 2 | 0.5 |
| 56 | 4 | 0.25 |
| 57 | 6 | 0.167 |
| 58 | 8 | 0.125 |
| 59 | 10 | 0.1 |

## Duty Cycle

The duty cycle has a value range from $0\left(0_{\text {hex }}\right)$ to $255\left(\mathrm{FF}_{\text {hex }}\right)$ at a resolution of $0.39 \%$ per LSB.
Value 0 stops the PWM function.
The values 1 to 255 correspond to $0.39 \%$ to $99.45 \%$ of the period.

The minimum duty cycle (high phase of the period) must be at least $40 \mu \mathrm{~s}$, the minimum low phase of the period must be at least $80 \mu \mathrm{~s}$.
The minimum low phase of the period at the 24 V output depends on the load:

| Load Resistance $R_{\mathrm{L}}$ | Minimum Low Phase <br> of the Period |
| :--- | :--- |
| $<1 \mathrm{k} \Omega$ | $80 \mu \mathrm{~s}$ |
| $<10 \mathrm{k} \Omega$ | $200 \mu \mathrm{~s}$ |
| $>10 \mathrm{k} \Omega$ | $250 \mu \mathrm{~s}$ |

## Example:

A signal is to be generated with the following properties:

- Period length $=200 \mathrm{~ms}$ (frequency $=1 /$ period length $=1 / 200 \mathrm{~ms}=5 \mathrm{~Hz}$ )
- Duty cycle $=40 \%$

The code for the operating mode and period length is determined using the table and is 50 hex.
The code for the duty cycle is determined as follows:
Code $=40 \% / 0.39 \%=102.564 ; 103=1100111_{\text {bin }}=67_{\text {hex }}$
The value of exactly $40 \%$ cannot be mapped. Either $40.17 \% ~\left(67_{\text {hex }}\right)$ or $39.78 \%\left(66_{\text {hex }}\right)$ is used.
Output word for the example

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| bin | 0 | 1 | 0 | Period length ( 5 bits) |  |  |  |  | Duty cycle in $0.39 \%$ per LSB (8 bits) |  |  |  |  |  |  |  |  |

| 1 s | 54 | 24.96 | 64 | 40 | 5440 |
| 10 s | 59 | 49.92 | 128 | 80 | 5980 |
| $200 \mu \mathrm{~s}$ | 41 | 74.88 | 192 | C0 | 41 C |
| 100 ms | 4 F | 99.45 | 255 | FF | 4FFF |

## 13 Frequency Generator Mode

This mode is used to specify a variable frequency for a constant duty cycle of $50 \%$. Continuous pulses are generated. Frequencies from 12.21 Hz to 50 kHz can be specified at a resolution of 12.21 Hz per LSB.

The 24 V output switches to 0 at a frequency $>500 \mathrm{~Hz}$.
This operating mode can be used, for example, to specify the drive speed.

6920A005
Figure 4 Frequency generator
Frequency generator mode can be selected for one channel or both channels. The corresponding output word has the following structure:
Output word

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| bin | 0 | 1 | 1 | Res. | Frequency in 12.21 Hz per LSB (12 bits) |  |  |  |  |  |  |  |  |  |  |  |

Res. $=$ Reserved ( $=0$ )
The corresponding input word contains the mirrored values of the output word.

## Example:

A signal with a frequency of 10 kHz is to be generated.

This frequency is only supported with a 5 V output.

The code for the frequency is determined as follows:
Code $=10 \mathrm{kHz} / 12.21 \mathrm{~Hz}=819=001100110011_{\text {bin }}=333_{\text {hex }}$
Output word for the example

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| bin | 0 | 1 | 1 | Res. | Frequency in 12.21 Hz per LSB (12 bits) |  |  |  |  |  |  |  |  |  |  |  |  |

## 14 Single Shot (Single Pulse Generator) Mode

In this operating mode, the terminal outputs a single pulse at the output for the specified time. A pulse length of between $10 \mu \mathrm{~s}$ and 25.5 s can be specified.
These pulses can be used, for example, to control the opening time of a valve.

6920A006
Figure 5 Two single shots with different length

## Pulse Length

To set the pulse length, specify a time base and a factor.

$$
\text { Pulse length = time base } \mathrm{x} \text { factor }
$$

Single shot mode can be selected for one channel or both channels. The corresponding output word has the following structure:

Output word

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| bin | 1 | 0 | 0 | Res. |  | Time base |  |  | Factor (8 bits) |  |  |  |  |  |  |  |

Res. $=$ Reserved $(=0)$
The corresponding input word has the following structure:
Input word

## Time Base

The time base defines the value range of the pulse length.

| Code (bin) | Code (hex) | Time Base | Maximum Time | Remark |
| :---: | :---: | :---: | :---: | :---: |
| 000 | 0 | $10 \mu \mathrm{~s}$ | 2.5 ms | Only for 5 V outputs |
| 001 | 1 | $100 \mu \mathrm{~s}$ | 25.5 ms |  |
| 010 | 2 | 1 ms | 255 ms |  |
| 011 | 3 | 10 ms | 2.5 s |  |
| 100 | 4 | 100 ms | 25.5 s |  |
| Other |  | Reserved |  |  |

The $10 \mu \mathrm{~s}$ time base is disabled for 24 V outputs.

If a value can be represented in different time bases, select the time base that represents the value most precisely (see also "Further Examples" on page 18).

## Factor

The factor has a value range from $0_{\text {dec }}$ to $255_{\text {dec }}$.
The value 0 stops the single shot function.

## Ready (Input word)

| Value | Meaning |
| :--- | :--- |
| 0 | Pulse generator has started |
| 1 | High phase has finished |

## Single Shot Sequence

Single shot mode is started by writing the time base and/or factor. The start is indicated in the input word by Ready $=0$.
If the high phase has finished, Ready $=1$ is set.
1 Moment at which unit and/or factor were modified

Figure 6 Sequence for generating a pulse after specifying a unit and/or factor
A new pulse is generated when the time base and/or factor is modified.

If the pulse length is modified while a pulse is being output, the active pulse output process is extended by the newly specified time. Therefore only modify the time base and the factor when Ready $=1$.

To generate the same pulse several times in succession, proceed as follows after each pulse generation:

- Wait until Ready = 1
(high phase of the pulse has finished)
- Set factor to 0
- Wait for confirmation by reading the input word (factor $=0$ )
- Set the factor to the desired value

Starting the pulse generator while Ready $=0$ (i.e., before the previously started single shot has finished) acts as a retrigger, which means the active pulse is extended by the newly specified time.

Each pulse at the 5 V output has a constant error of $5 \mu \mathrm{~s}$, each pulse at the 24 V output has a constant error of $100 \mu \mathrm{~s}$.

## Example:

A single shot with a duration of 12 s is to be generated.

- Time base: 100 ms (time base code $=4_{\text {hex }}$ )
- Factor: $12 \mathrm{~s} / 100 \mathrm{~ms}=120=1111000_{\text {bin }}=78_{\text {hex }}$

Output word for the example

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| bin | 1 | 0 | 0 | Res. |  | Time base |  |  | Factor (8 bits) |  |  |  |  |  |  |  |
| bin | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |
| hex | 8 |  |  |  | 4 |  |  |  | 7 |  |  |  | 8 |  |  |  |

Further Examples

OUT = Output word
The gray cells represent values, which cannot be represented in this time base as they are outside the permissible value range.
The values indicated with "-" are values, which cannot be represented precisely in this time base even though they are within the permissible value range of the time base. Only a rounded value can be represented. To represent the value precisely, select a different time base.

## 15 Pulse Direction Signal Mode

In this mode, both outputs are used together, which means that only one channel is available. Together with the freely controllable output DO2, this operating mode also represents a pulse direction interface.

Pulse trains, whose frequency can be selected, are output as pulse direction signals. The frequency is evaluated by the connected stepper motor in such a way that each pulse is converted into steps. The motor speed increases in proportion to the frequency, which means that the frequency can be used to influence the speed of the motor. A positioning counter counts the completed steps so that the drive position can also be read.

This operating mode can be used for variable speed drives with no position specifications (target position $=$ FFFFF $_{\text {hex }}$ ). In this case, the position is evaluated by a higher-level control system and the motor is controlled via the higher-level control system.

However, this operating mode can also be used for variable speed drives with position specifications. In this case the Inline terminal stops the motor automatically when the specified target position is reached.

Output words 0 and 1

| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

$N \quad$ Reset
Reset
Input words 0 and 1

DO2 Image of output DO2
R Ready Ready $=0 \quad$ Pulse output process active

Res. Reserved

## RDO2 (Direction and Output DO2)

This bit controls output DO2 and therefore indirectly controls the counting direction of the positioning counter.

RDO2 = 0: down or reverse
RDO2 = 1: up or forwards

## N (Reset)

On a rising edge of the bit to 1 , the positioning counter resets to $0000000_{\text {hex }}$.
The values $\mathrm{N}=1$ and Frequency $=0$ stop the operating mode.

## Frequency (11 Bits)

The frequency code has a range from 0 Hz to 25 kHz , which provides a resolution of $12.21 \mathrm{~Hz} / \mathrm{LSB}$. The duty cycle remains constant at $50 \%$.
The value 0 aborts the active pulse output process.
The values $\mathrm{N}=1$ and Frequency $=0$ stop the operating mode.
Changing the frequency is immediately accepted.

## Target Position (16 Bits)

The target position has a value range from $0_{\text {hex }}$ to $\mathrm{FFFE}_{\text {hex }}$ ( $0_{\text {dec }}$ to $65534_{\text {dec }}$ ).
The value FFFF $_{\text {hex }}\left(65535_{\text {dec }}\right)$ results in an infinite pulse output process.
A value between $0_{\text {hex }}$ and FFFE $_{\text {hex }}$ stops the pulse output process if the 16 least significant bits of the positioning counter are the same as the target position.
Pulses are output at output DO1. Direction bit RDO2 specifies the counting direction.

## DO2 (Image of Output DO2)

This bit indicates the status of output DO2.

## R (Ready)

This bit is only active when a finite pulse output process is selected (target position between $0_{\text {hex }}$ and FFFE hex $_{\text {) }}$. The Ready bit then indicates whether or not a pulse output process has been completed.
Ready $=0$ : Pulse output process active Ready = 1: Pulse output process completed
The bit is reset when a new pulse output process is started.

## Positioning Counter (25 Bits)

The positioning counter counts the previously output pulses either up or down depending on signal RDO2.

## Response to Specific Conditions:

| Action | Response |
| :---: | :---: |
| Frequency = 0 | Pulse output process stops |
| Frequency modification without target position modification | ```Ready No response = 1: Ready Frequency modified during the = 0: active pulse output process``` |
| Frequency modification with target position modification | Ready Start new pulse output process = 1 : <br> Ready Frequency modified during the = 0 : active pulse output process |
| Target position modification | Ready Start new pulse output process = 1 : <br> Ready The old target position is = 0: rejected, the pulse output process is continued until the target position is reached |
| Target position $=0$ | Normal target position |
| $\begin{aligned} & \text { Target position } \\ & =\text { FFFF }_{\text {hex }} \\ & \hline \end{aligned}$ | Continuous pulse output process |
| Rising edge of the Reset bit | Positioning counter is cleared, regardless of Ready value |
| RDO2 bit | Output DO2 is controlled directly. The counting direction changes on the next pulse output process. <br> When the value of bit RDO2 is modified, but the frequency and target position remain unchanged, there is no response at output 2 , i.e., the specified value is not accepted. <br> In the input word, the actual status of output 2 is mirrored in bit DO2, i.e., in this case the value is not identical to the value specified in RDO2. |

## Example 1:

The required movement is from position 0 to the target position $1 B 43_{\text {hex }}$.
The value is approached in a positive direction (forwards), i.e., RDO2 $=1$.
The frequency is to be 1 kHz .
Frequency code: $1000 \mathrm{~Hz} / 12.21 \mathrm{kHz}=81.9 ; \quad 82_{\mathrm{dec}}=52_{\text {hex }}=00001010010_{\text {bin }}$
Output words 0 and 1

The pulse output process is stopped when the value $1 \mathrm{~B} 43_{\text {hex }}$ is reached in input word 1 . During the process, $1 \mathrm{~B} 43_{\text {hex }}=$ $6979_{\text {dec }}$ pulses were output with a frequency of 1 kHz .

## Example 2:

The required movement is to a target position, whose code is greater than the value that can be represented in 16 bits.
Target position $=\mathbf{2 1 5 6 8 7}$ hex
RDO2 $=1$
Frequency $=10 \mathrm{kHz} ; 10,000 \mathrm{~Hz} / 12.21 \mathrm{~Hz}=819_{\text {dec }}=333_{\text {hex }}$

- In output word 1 enter the value FFFF $_{\text {hex }}$ to select a continuous pulse output process.

Output words 0 and 1

- Monitor the positioning counter in the input words.

As soon as the value $\mathrm{B} 021_{\text {hex }}$ appears in input word 0 , specify the four low bytes of target position $5687_{\text {hex }}$ in output word 1.

Input words 0 and 1

| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
